

ABSTRACTION:

Imagine using an ATM machine as a function. You approach the ATM (function call) and insert your bank card (arguments). You then input the amount of money you want to withdraw (parameters) and press the appropriate buttons. Behind the scenes, the ATM processes your request, deducts the specified amount from your account, and dispenses the cash (return value). As a user, you're only concerned with getting the money you need, not the intricate workings of the ATM's internal mechanisms.
