PSEUDOCODE

Defining Function fcc
{

        Opening fixo_filename and reads all fixos into a vector
        Opening typo_filename and reads all typos into a vector

        Checking if Number of typos = number of fixos

        Opening fixme_filename to read sentence

        Iterating through sentence word by word

        Checking if word == typo

            If word == typo {
            word == fixos(i)
            append word to sentence }

            If word != typo {
            append word to sentence }

            Append " " to sentence

            Removing " " from end of sentence:

            Fixed sentence = sentence

Return -1

}
